Shape processing: speed

Clockwise and anti-clockwise spirals

Clockwise

Anti-clockwise

Two anti-clockwise in alternation

Two in alternation, and sum of the two

Rapid alternation

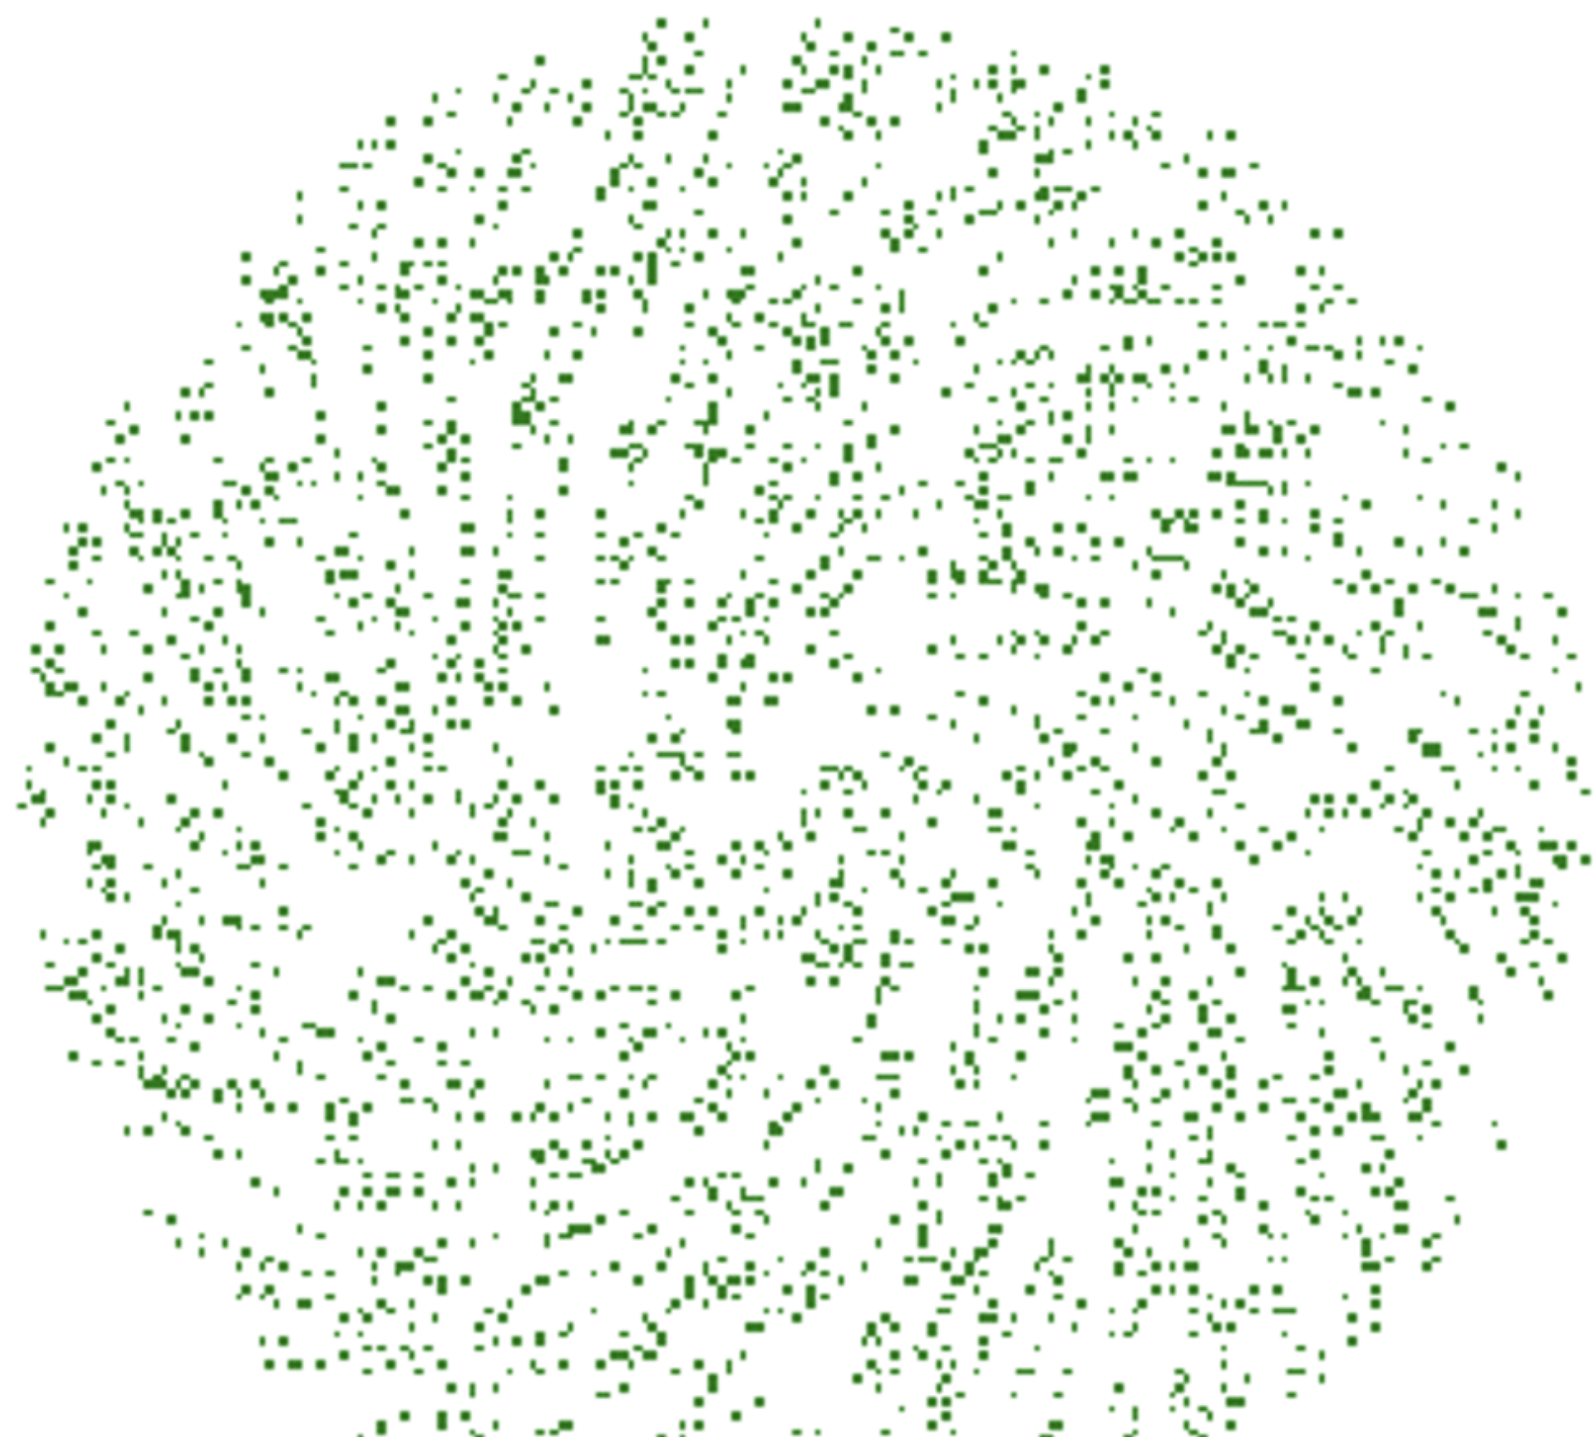

Rapid alternation

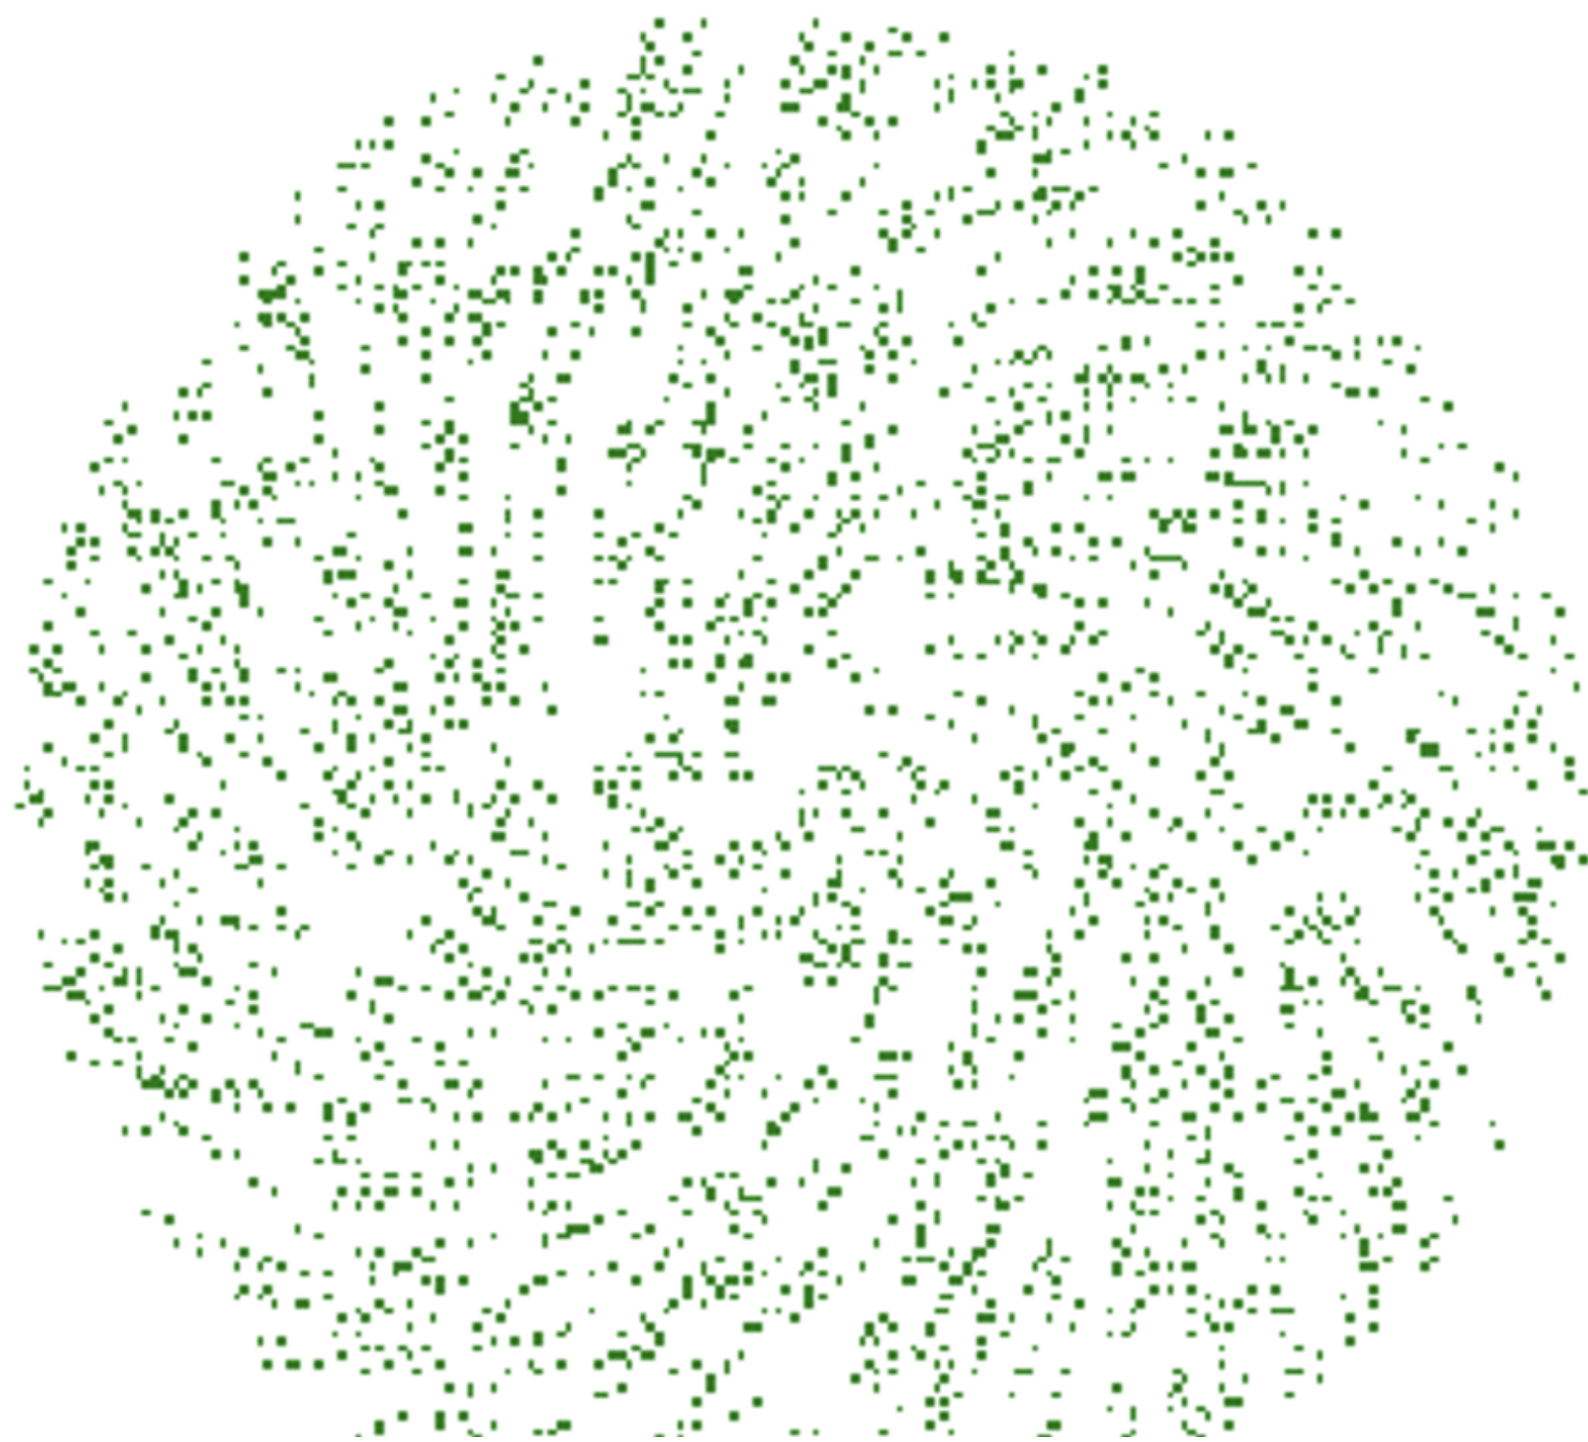

- Can still perceive even at 30 images per second
- Implies that shape is computed in less than 0.06 sec

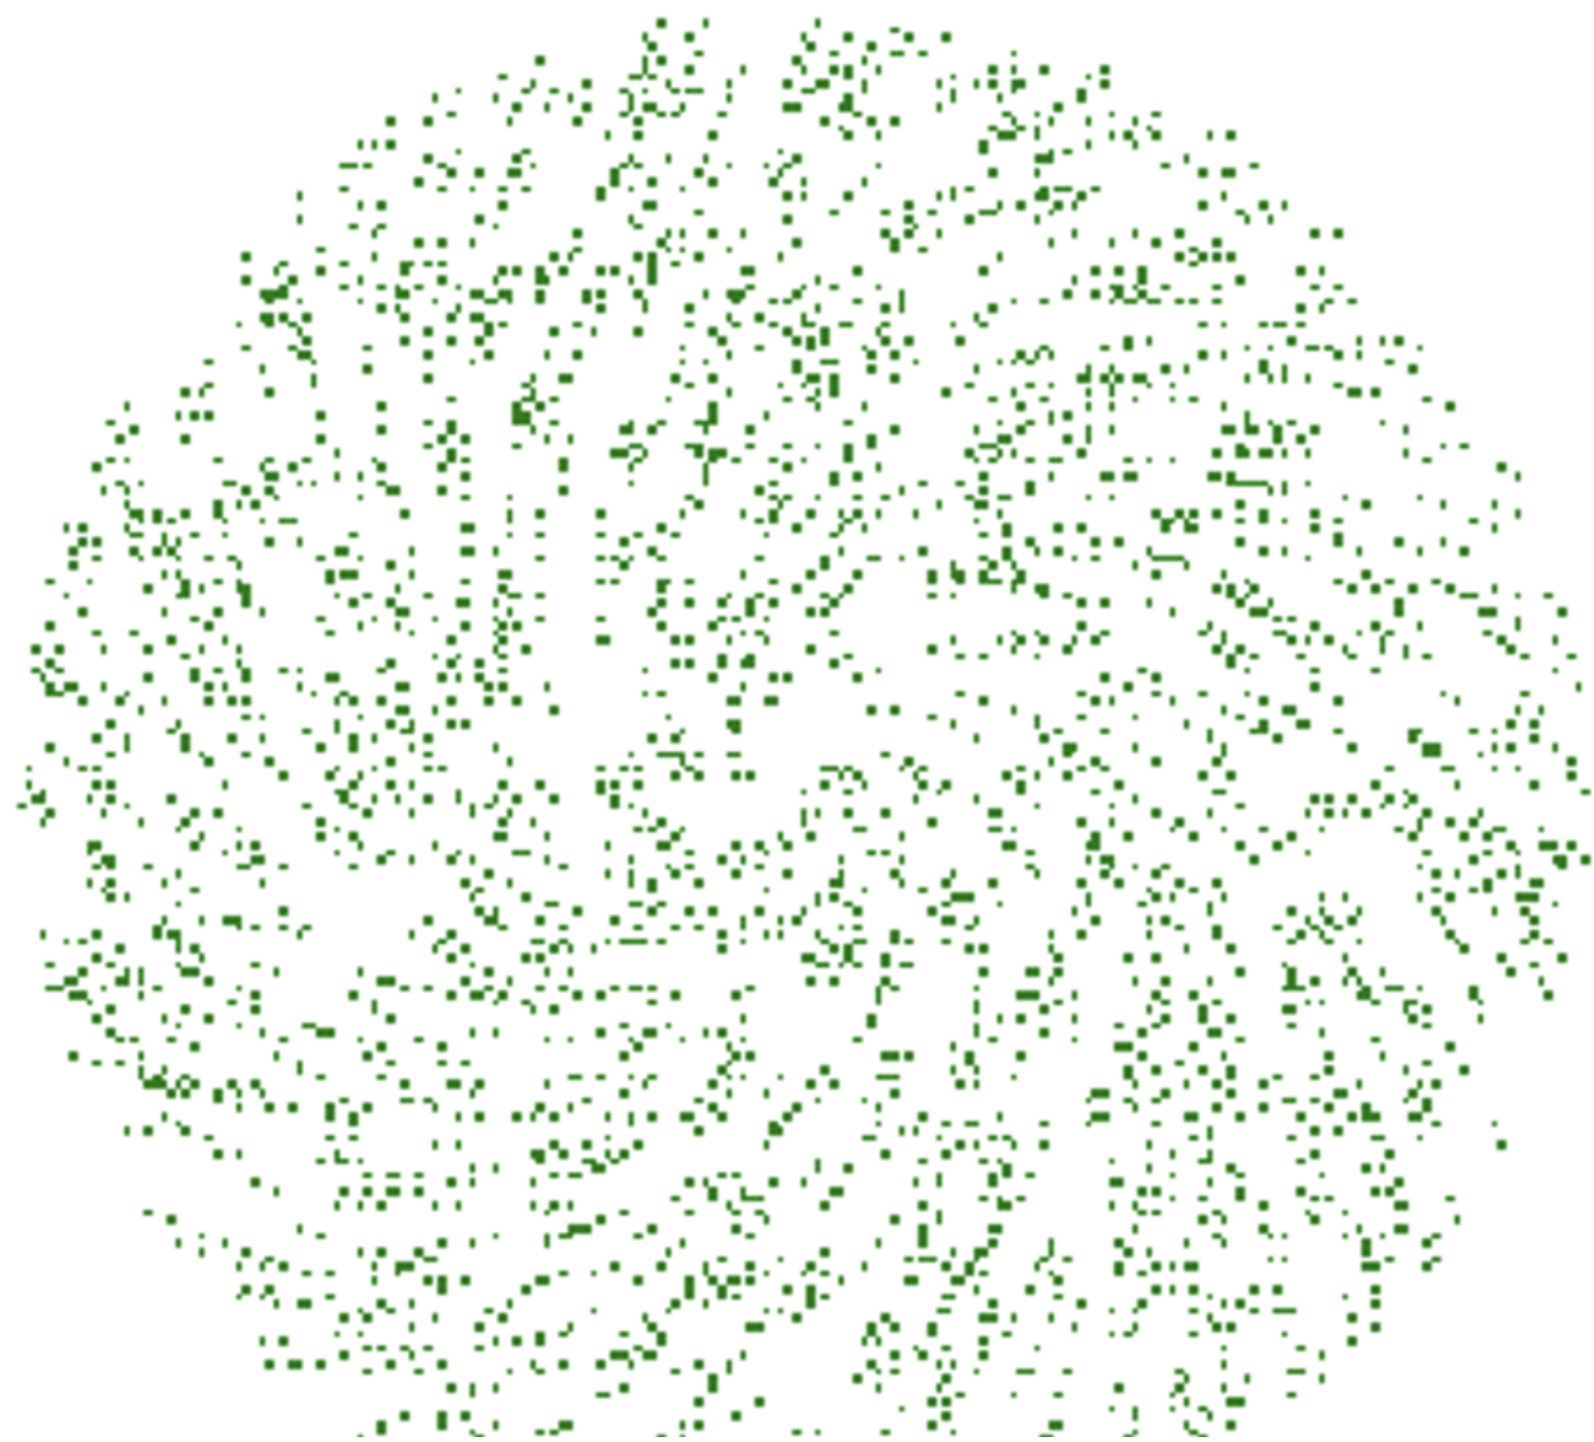

Alternating pattern with noise

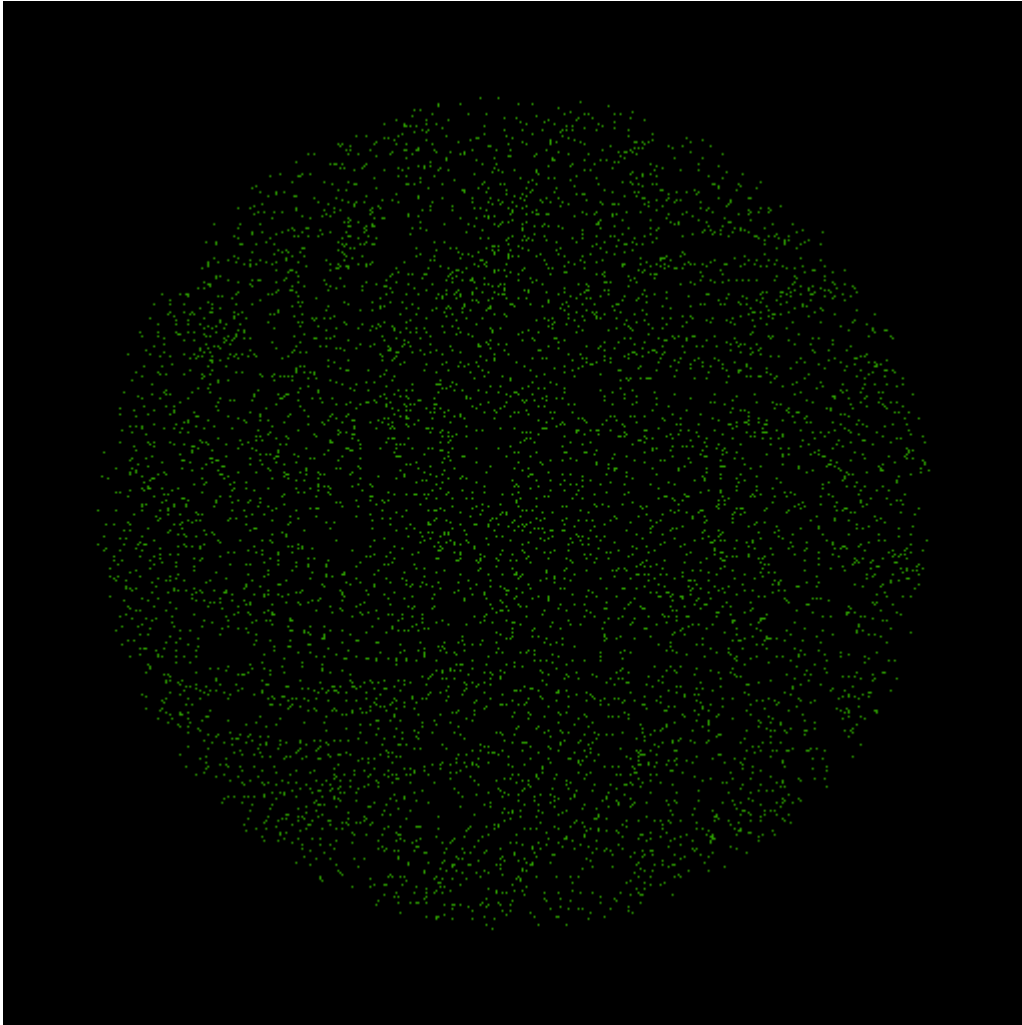

Alternating pattern with noise

Fast alternation pattern with noise

Two colored spirals

Rapid alternation

- Shape elements bound and processed quickly
- Color of shape is lost

4 Responses

Should we focus on trying to memorise specific experiments and their results or just prioritise conceptual understanding?

Prioritise conceptual, but for any essay answers you need to have examples, like experiments.

The diagrammed model in the Shapes slides

Ask a more specific question or come see me to discuss.

What does Circular or radial tell us?

If you could say which one it was, that meant your visual system successfully identified the shape.

Do we need to remember the exact response times for the experiments mentioned in the textbook?

No
