Hi Alex,

I give just one lecture on attention as part of PSYC1002. Here are the learning outcomes:

Lecture 2

- Understand and be able to give examples of situations where focused visual or auditory attention leads to limited processing of other stimuli.
- Be able to define, distinguish and give examples of focused attention, divided attention, inattentional blindness, and change blindness.
- Understand and be able to describe the difference between an early, late or flexible locus of selection.
- Be able to both give and interpret examples which demonstrate an early, late or flexible locus of selection.
- Be able to define and distinguish between endogenous and exogenous attention as it relates to guided search and attentional capture.
- Understand the role of attention according to Treisman's FIT (feature integration theory) and the visual search evidence (for both feature and conjunction targets) which supports it.

When I previously lectured in PSYC2016 I would follow up on the Treisman FIT with Wolfe's guided search (and criticisms of FIT) so it was more a progression than contradiction.

Caleb

Subject: attention in PSYC1

Hi Caleb,

I hope you're well.

Because I teach about attention in PSYC2016, I wanted to review any attention material you have from 2024 PSYC100X, to tweak my material to avoid contradicting or possibly having too much overlap. Perhaps you could send me that?

best

-Alex
